

# Package: panelvar (via r-universe)

August 22, 2024

**Type** Package

**Title** Panel Vector Autoregression

**Version** 0.5.5

**Description** We extend two general methods of moment estimators to panel vector autoregression models (PVAR) with  $p$  lags of endogenous variables, predetermined and strictly exogenous variables. This general PVAR model contains the first difference GMM estimator by Holtz-Eakin et al. (1988) <doi:10.2307/1913103>, Arellano and Bond (1991) <doi:10.2307/2297968> and the system GMM estimator by Blundell and Bond (1998) <doi:10.1016/S0304-4076(98)00009-8>. We also provide specification tests (Hansen overidentification test, lag selection criterion and stability test of the PVAR polynomial) and classical structural analysis for PVAR models such as orthogonal and generalized impulse response functions, bootstrapped confidence intervals for impulse response analysis and forecast error variance decompositions.

**License** GPL (>= 2)

**LazyData** TRUE

**Depends** R (>= 3.5.0)

**Imports** knitr, MASS, Matrix (>= 1.2-11), progress, matrixcalc, texreg, ggplot2, reshape2

**Suggests** rmarkdown

**Encoding** UTF-8

**RoxygenNote** 7.2.2

**NeedsCompilation** no

**Author** Michael Sigmund [aut], Robert Ferstl [aut, cre]

**Maintainer** Robert Ferstl <robert.ferstl@ur.de>

**Date/Publication** 2023-01-05 17:40:05 UTC

**Repository** <https://datarob.r-universe.dev>

**RemoteUrl** <https://github.com/cran/panelvar>

**RemoteRef** HEAD

<i>abdata</i>	<i>Employment UK data</i>
---------------	---------------------------

---

### Description

This data set contains labor demand data from a panel of firms in the United Kingdom. The panel is unbalanced.

### Usage

*abdata*

### Format

The variables are:

**c1** Record ID

**ind** Firm index

**year** Year

**emp** Employment

**wage** Wage

**cap** Capital

**indoutpt** Industrial output

**n, w, k, ys** Logs of variables

**rec** Record number

**yearm1** Lagged year

**id** ID

**nL1, nL2, wL1, kL1, kL2, ysL1, ysL2** Lags of log variables

**yr1976 - yr1984** Time dummies

---

 Andrews\_Lu\_MMSC

*Andrews Lu MMSC Criteria based on Hansen-J-Statistic*

---

### Description

...

### Usage

```
Andrews_Lu_MMSC(model, HQ_criterion = 2.1)
```

```
## S3 method for class 'pvargmm'
```

```
Andrews_Lu_MMSC(model, HQ_criterion = 2.1)
```

### Arguments

model            A PVAR model

HQ\_criterion    Hannan Quinn criterion

### Value

BIC, AIC and HQIC

### References

Andrews, D., Lu, B. (2001) Consistent Model and Moment Selection Procedures for GMM Estimation with Application to Dynamic Panel Data Models, *Journal of Econometrics*, **101**(1), 123–164, doi:[10.1016/S03044076\(00\)000774](https://doi.org/10.1016/S03044076(00)000774)

### Examples

```
data("ex3_abdata")
Andrews_Lu_MMSC(ex3_abdata)
```

---

 bootstrap\_irf

*Empirical estimation of PVAR Impulse Response Confidence Bands*

---

### Description

Uses blockwise sampling of individuals (bootstrapping).

```
confidence.band = 0.95,  
mc.cores = 100)  
  
## End(Not run)  
data("ex1_dahlberg_data")  
ex1_dahlberg_data_girf <- girf(ex1_dahlberg_data, n.ahead = 8, ma_approx_steps= 8)  
data("ex1_dahlberg_data_bs")  
plot(ex1_dahlberg_data_girf, ex1_dahlberg_data_bs)
```

---

Cigar

*Cigar data*

---

### Description

This panel data set consists of 46 U.S. States over the period 1963-1992.

### Usage

Cigar

### Format

The variables are:

**state** State abbreviation

**year** Year

**price** Price per pack of cigarettes

**pop** Population

**pop16** Population above the age of 16.

**cpi** Consumer price index with (1983=100

**ndi** Per capita disposable income

**sales** Cigarette sales in packs per capita

**pimin** Minimum price in adjoining states per pack of cigarettes

All variables all also available as logs.

coef.pvarfeols	<i>Extract PVARFEOLS(p) Model Coefficients</i>
----------------	--

---

**Description**

Extract PVARFEOLS(p) Model Coefficients

**Usage**

```
## S3 method for class 'pvarfeols'
coef(object, ...)
```

**Arguments**

object	object
...	further arguments

---

coef.pvargmm	<i>Extract PVAR(p) Model Coefficients</i>
--------------	---

---

**Description**

Extract PVAR(p) Model Coefficients

**Usage**

```
## S3 method for class 'pvargmm'
coef(object, ...)
```

**Arguments**

object	object
...	further arguments

**Examples**

```
data("ex1_dahlberg_data")
coef(ex1_dahlberg_data)
```

---

coef.pvarhk	<i>Extract PVARHK(p) Model Coefficients</i>
-------------	---

---

### Description

Extract PVARHK(p) Model Coefficients

### Usage

```
## S3 method for class 'pvarhk'
coef(object, ...)
```

### Arguments

object	object
...	further arguments

---

Dahlberg	<i>Swedish municipalities data</i>
----------	------------------------------------

---

### Description

The panel data set consists of 265 Swedish municipalities and covers 9 years (1979-1987).

### Usage

Dahlberg

### Format

The variables are:

**id** ID number for municipality

**year** Year

**expenditures** Total expenditures

**revenues** Total own-source revenues

**grants** Intergovernmental grants received by the municipality

Total expenditures contains both capital and current expenditures.

Expenditures, revenues, and grants are expressed in million SEK. The series are deflated and in per capita form. The implicit deflator is a municipality-specific price index obtained by dividing total local consumption expenditures at current prices by total local consumption expenditures at fixed (1985) prices.

The data are gathered by Statistics Sweden and obtained from Financial Accounts for the Municipalities (Kommunernas Finanser).

ex1_dahlberg_data	<i>Dahlberg results example 1</i>
-------------------	-----------------------------------

---

**Description**

Dahlberg results example 1

**Usage**

ex1\_dahlberg\_data

**Format**

An object of class pvargmm of length 35.

---

ex1_dahlberg_data_bs	<i>Dahlberg bootstrap results example 1</i>
----------------------	---

---

**Description**

Dahlberg bootstrap results example 1

**Usage**

ex1\_dahlberg\_data\_bs

**Format**

An object of class list of length 4.

---

ex2\_nlswork2\_data\_bs    *NLS Work 2 bootstrap results example 2*

---

**Description**

NLS Work 2 bootstrap results example 2

**Usage**

ex2\_nlswork2\_data\_bs

**Format**

An object of class `list` of length 4.

---

ex3\_abdata    *Example results for Employment UK data*

---

**Description**

Example results for Employment UK data

**Usage**

ex3\_abdata

**Format**

An object of class `pvargmm` of length 36.

---

extract    *Extract Coefficients and GOF Measures from a Statistical Object*

---

**Description**

Extract Coefficients and GOF Measures from a Statistical Object

**Usage**

```
extract(model, ...)

## S3 method for class 'pvargmm'
extract(model, ...)

## S3 method for class 'pvarfeols'
extract(model, ...)

## S3 method for class 'pvarhk'
extract(model, ...)
```

**Arguments**

model	Model
...	Further arguments passed to or from other methods

**Examples**

```
data("ex1_dahlberg_data")
extract(ex1_dahlberg_data)
```

---

fevd_orthogonal	<i>Forecast Error Variance Decomposition for PVAR</i>
-----------------	---

---

**Description**

Computes the forecast error variance decomposition of a PVAR(p) model.

**Usage**

```
fevd_orthogonal(model, n.ahead = 10)

## S3 method for class 'pvargmm'
fevd_orthogonal(model, n.ahead = 10)

## S3 method for class 'pvarfeols'
fevd_orthogonal(model, n.ahead = 10)
```

**Arguments**

model	A PVAR model
n.ahead	Number of steps

**Details**

The estimation is based on orthogonalised impulse response functions.

**Value**

A list with forecast error variances as matrices for each variable.

**Note**

A plot method will be provided in future versions.

**References**

**See Also**

[pvargmm](#) for model estimaion

[oirf](#) for orthogonal impulse response function

**Examples**

```
data("ex1_dahlberg_data")
fevd_orthogonal(ex1_dahlberg_data, n.ahead = 8)
```

---

fixedeffects

*Extracting Fixed Effects*

---

**Description**

Extracting Fixed Effects

**Usage**

```
fixedeffects(model, ...)

## S3 method for class 'pvargmm'
fixedeffects(model, Only_Non_NA_rows = TRUE, ...)
```

**Arguments**

model	Model
...	Further arguments passed to or from other methods
Only_Non_NA_rows	Filter NA rows

**Examples**

```
data("ex1_dahlberg_data")
fixedeffects(ex1_dahlberg_data)
```

---

girf	<i>Generalized Impulse Response Function</i>
------	--

---

**Description**

Generalized Impulse Response Function

**Usage**

```
girf(model, n.ahead, ma_approx_steps)
```

```
## S3 method for class 'pvargmm'
girf(model, n.ahead, ma_approx_steps)
```

**Arguments**

model	A PVAR model
n.ahead	Any stable AR() model has an infinite MA representation. Hence any shock can be simulated infinitely into the future. For each forecast step t you need an additional MA term.
ma_approx_steps	MA approximation steps

**Examples**

```
data("ex1_dahlberg_data")
girf(ex1_dahlberg_data, n.ahead = 8, ma_approx_steps= 8)
```

---

hansen_j_test	<i>Sargan-Hansen-J-Test for Overidentification</i>
---------------	--

---

**Description**

Sargan-Hansen-J-Test for Overidentification

**Usage**

```
hansen_j_test(model, ...)
```

```
## S3 method for class 'pvargmm'
hansen_j_test(model, ...)
```

**Arguments**

model	A PVAR model
...	Further arguments passed to or from other methods

**Examples**

```
data("ex1_dahlberg_data")
hansen_j_test(ex1_dahlberg_data)
```

---

knit\_print.pvarfeols *Knit Print Method for pvarfeols*

---

**Description**

Knit Print Method for pvarfeols

**Usage**

```
## S3 method for class 'pvarfeols'

---

nlswork2	<i>NLS Work 2 data</i>
----------	------------------------

---

**Description**

NLS Work 2 data

**Usage**

```
nlswork2
```

**Format**

An object of class `data.frame` with 16094 rows and 21 columns.

---

oirf	<i>Orthogonal Impulse Response Function</i>
------	---

---

**Description**

Orthogonal Impulse Response Function

**Usage**

```
oirf(model, n.ahead)
```

**Arguments**

model	A PVAR model
n.ahead	Any stable AR() model has an infinite MA representation. Hence any shock can be simulated infinitely into the future. For each forecast step $t$ you need an additional MA term.

**Examples**

```
data("ex1_dahlberg_data")  
oirf(ex1_dahlberg_data, n.ahead = 8)
```

---

plot.pvarstability      *S3 plot method for pvarstability object, returns a ggplot object*

---

**Description**

S3 plot method for pvarstability object, returns a ggplot object

**Usage**

```
## S3 method for class 'pvarstability'  
plot(x, ...)
```

**Arguments**

x	object
...	further arguments

---

print.pvarfeols      *S3 Print Method for pvarfeols*

---

**Description**

S3 Print Method for pvarfeols

**Usage**

```
## S3 method for class 'pvarfeols'  
print(x, ...)
```

**Arguments**

**Examples**

```
data("ex1_dahlberg_data")
pvalue(ex1_dahlberg_data)
```

---

pvarfeols	<i>Fixed Effects Estimator for PVAR Model</i>
-----------	---

---

**Description**

This function estimates a stationary PVAR with fixed effects.

**Usage**

```
pvarfeols(
  dependent_vars,
  lags,
  exog_vars,
  transformation = c("demean"),
  data,
  panel_idenfifier = c(1, 2)
)
```

**Arguments**

dependent\_vars Dependent variables  
 lags Number of lags of dependent variables  
 exog\_vars Exogenous variables  
 transformation Demeaning "demean"  
 data Data set  
 panel\_Identifier  
                   Vector of panel identifiers

**Examples**

```

data(Cigar)
ex1_feols <-
pvarfeols(dependent_vars = c("log_sales", "log_price"),
           lags = 1,
           exog_vars = c("cpi"),
           transformation = "demean",
           data = Cigar,
           panel_Identifier= c("state", "year"))

summary(ex1_feols)

```

---

 pvargmm

*GMM Estimation of Panel VAR Models*

---

**Description**

Estimates a panel vector autoregressive (PVAR) model with fixed effects.

**Usage**

```

pvargmm(
  dependent_vars,
  lags,
  predet_vars,
  exog_vars,
  transformation = "fd",
  data,
  panel_Identifier = c(1, 2),
  steps,
  system_instruments = FALSE,
  system_constant = TRUE,
  pca_instruments = FALSE,
  pca_eigenvalue = 1,
  max_instr_dependent_vars,
  max_instr_predet_vars,

```

```

    min_instr_dependent_vars = 2L,
    min_instr_predet_vars = 1L,
    collapse = FALSE,
    tol = 1e-09,
    progressbar = TRUE
)

```

## Arguments

<code>dependent_vars</code>	Dependent variables
<code>lags</code>	Number of lags of dependent variables
<code>predet_vars</code>	Predetermined variables
<code>exog_vars</code>	Exogenous variables
<code>transformation</code>	First-difference "fd" or forward orthogonal deviations "fod"
<code>data</code>	Data set
<code>panel_identifier</code>	Vector of panel identifiers
<code>steps</code>	"onestep", "twostep" or "mstep" estimation
<code>system_instruments</code>	System GMM estimator
<code>system_constant</code>	Constant only available with the System GMM estimator in each equation
<code>pca_instruments</code>	Apply PCA to instruments matrix
<code>pca_eigenvalue</code>	Cut-off eigenvalue for PCA analysis
<code>max_instr_dependent_vars</code>	Maximum number of instruments for dependent variables
<code>max_instr_predet_vars</code>	Maximum number of instruments for predetermined variables
<code>min_instr_dependent_vars</code>	Minimum number of instruments for dependent variables
<code>min_instr_predet_vars</code>	Minimum number of instruments for predetermined variables
<code>collapse</code>	Use collapse option
<code>tol</code>	relative tolerance to detect zero singular values in "ginv"
<code>progressbar</code>	show progress bar

## Details

The first vector autoregressive panel model (PVAR) was introduced by Holtz-Eakin et al. (1988). Binder et al. (2005) extend their equation-by-equation estimator for a PVAR model with only endogenous variables that are lagged by one period. We further improve this model in Sigmund and Ferstl (2021) to allow for  $p$  lags of  $m$  endogenous variables,  $k$  predetermined variables and  $n$  strictly exogenous variables.

Therefore, we consider the following stationary PVAR with fixed effects.

$$\mathbf{y}_{i,t} = \mu_i + \sum_{l=1}^p \mathbf{A}_l \mathbf{y}_{i,t-l} + \mathbf{B} \mathbf{x}_{i,t} + \mathbf{C} \mathbf{s}_{i,t} + \epsilon_{i,t}$$

$\mathbf{I}_m$  denotes an  $m \times m$  identity matrix. Let  $\mathbf{y}_{i,t} \in \mathbf{R}^m$  be an  $m \times 1$  vector of endogenous variables for the  $i$ th cross-sectional unit at time  $t$ . Let  $\mathbf{y}_{i,t-l} \in \mathbf{R}^m$  be an  $m \times 1$  vector of lagged endogenous variables. Let  $\mathbf{x}_{i,t} \in \mathbf{R}^k$  be an  $k \times 1$  vector of predetermined variables that are potentially correlated with past errors. Let  $\mathbf{s}_{i,t} \in \mathbf{R}^n$  be an  $n \times 1$  vector of strictly exogenous variables that neither depend on  $\epsilon_t$  nor on  $\epsilon_{t-s}$  for  $s = 1, \dots, T$ . The idiosyncratic error vector  $\epsilon_{i,t} \in \mathbf{R}^m$  is assumed to be well-behaved and independent from both the regressors  $\mathbf{x}_{i,t}$  and  $\mathbf{s}_{i,t}$  and the individual error component  $\mu_i$ . Stationarity requires that all unit roots of the PVAR model fall inside the unit circle, which therefore places some constraints on the fixed effect  $\mu_i$ . The cross section  $i$  and the time section  $t$  are defined as follows:  $i = 1, 2, \dots, N$  and  $t = 1, 2, \dots, T$ . In this specification we assume parameter homogeneity for  $\mathbf{A}_l(m \times m)$ ,  $\mathbf{B}(m \times k)$  and  $\mathbf{C}(m \times n)$  for all  $i$ .

A PVAR model is hence a combination of a single equation dynamic panel model (DPM) and a vector autoregressive model (VAR).

First difference and system GMM estimators for single equation dynamic panel data models have been implemented in the STATA package `xtabond2` by Roodman (2009) and some of the features are also available in the R package `plm`.

For more technical details on the estimation, please refer to our paper Sigmund and Ferstl (2021).

There we define the first difference moment conditions (see Holtz-Eakin et al., 1988; Arellano and Bond, 1991), formalize the ideas to reduce the number of moment conditions by linear transformations of the instrument matrix and define the one- and two-step GMM estimator. Furthermore, we setup the system moment conditions as defined in Blundell and Bond (1998) and present the extended GMM estimator. In addition to the GMM-estimators we contribute to the literature by providing specification tests (Hansen overidentification test, lag selection criterion and stability test of the PVAR polynomial) and classical structural analysis for PVAR models such as orthogonal and generalized impulse response functions, bootstrapped confidence intervals for impulse response analysis and forecast error variance decompositions. Finally, we implement the first difference and the forward orthogonal transformation to remove the fixed effects.

## Value

A `pvargmm` object containing the estimation results.

---

pvarhk

*Hahn Kuehrsteiner Estimator for PVAR Model*

---

## Description

This function estimates a stationary PVAR with fixed effects.

## Usage

```

pvarhk(
  dependent_vars,
  exog_vars,
  transformation = c("demean"),
  data,
  panel_identifier = c(1, 2)
)

```

## Arguments

dependent\_vars    Dependent variables  
 exog\_vars        Exogenous variables  
 transformation    Demeaning "demean"  
 data             Data set  
 panel\_identifier    Vector of panel identifiers

## References

Hahn J., Kuehrsteiner G. (2002) Asymptotically Unbiased Inference for a Dynamic Panel Model with Fixed Effects When Both n and T Are Large, *Econometrica*, **70**(4), 1639–1657

**Examples**

```

data(Dahlberg)
ex1_hk <-
pvarhk(dependent_vars = c("expenditures", "revenues", "grants"),
        transformation = "demean",
        data = Dahlberg,
        panel_identif= c("id", "year"))

summary(ex1_hk)

```

---

residuals_level	<i>Extracting Level Residuals</i>
-----------------	-----------------------------------

---

**Description**

Extracting Level Residuals

**Usage**

```

residuals_level(model, ...)

## S3 method for class 'pvargmm'
residuals_level(model, ...)

```

**Arguments**

model	Model
...	Further arguments passed to or from other methods

**Examples**

```

data("ex1_dahlberg_data")
residuals_level(ex1_dahlberg_data)
